

Code Generation for Embedded Systems

Real-time Control Using Modelica_DeviceDrivers

Overview

Part I	Modelica_DeviceDrivers
Part II	Example: Single Board Heater System (SBHS)
Part III	OpenModelica Code Generator for Embedded
Systems	
Part IV	Conclusion

Part I

Modelica_DeviceDrivers

Modelica_DeviceDrivers

-  Modelica_DeviceDrivers
 - ▶  UsersGuide
 - ▶  Blocks
 - ▶  ClockedBlocks
 - ▶  Packaging
 - ▶  Communication
 - ▶  HardwareIO
 - ▶  InputDevices
 - ▶  OperatingSystem
 -  EmbeddedTargets
 -  AVR
 -  Blocks
 - Microcontroller
 -  ADC
 -  DigitalReadBoolean
 -  DigitalWriteBoolean
 -  PWM
 - SynchronizeRealtime
 - ▶  Functions
 - ▶  Constants
 - ▶  Types
 - ▶  Examples
 - ▶  Utilities
 - ▶  Incubate

- ▶ **Free library** for interfacing hardware drivers.
- ▶ **Cross-platform** (Windows and Linux).
- ▶ I/O and communication.
- ▶ Supports **interactive real-time** simulations.
- ▶ Now also includes code for embedded targets.

Modelica_DeviceDrivers: Embedded Targets

-  Modelica_DeviceDrivers
 - ▶  UsersGuide
 - ▶  Blocks
 - ▶  ClockedBlocks
 - ▶  Packaging
 - ▶  Communication
 - ▶  HardwareIO
 - ▶  InputDevices
 - ▶  OperatingSystem
 -  EmbeddedTargets
 -  AVR
 -  Blocks
 - Microcontroller
 -  ADC
 -  DigitalReadBoolean
 -  DigitalWriteBoolean
 -  PWM
 - SynchronizeRealtime
 - ▶  Functions
 - ▶  Constants
 - ▶  Types
 - ▶  Examples
 - ▶  Utilities
 - ▶  Incubate

- ▶ Explicitly model the hardware available in the microcontroller.
- ▶ The library includes external objects that deal with the microcontroller constants and flags.
- ▶ The AVR package handles Atmel's ATmega microcontrollers and includes analog and digital I/O as well as real-time synchronization.

Part II

Example: Single Board Heater System (SBHS)

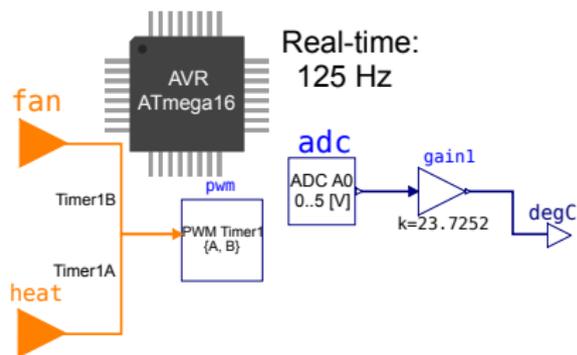

Single Board Heater System (SBHS)

One of the AVR examples included in MDD is the *Single Board Heater System* (SBHS, <http://sbhs.fossee.in/>), which was developed by IIT Bombay and is used for teaching and learning control systems. It consists of:

- ▶ Heater assembly
- ▶ Fan
- ▶ Temperature sensor
- ▶ AVR ATmega16 microcontroller
- ▶ Associated circuitry

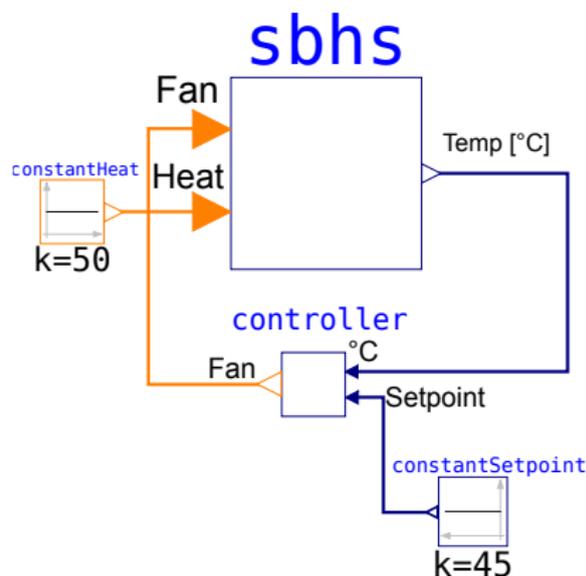

Modeling the SBHS

- ▶ Uses a real-time controller (here set @125 Hz).
- ▶ Uses pulse width modulation (PWM) to control the heater and fan.
- ▶ Uses an analog-to-digital converter (ADC) block to read the temperature (0V=0C, linear gain; the SBHS does the rest in hardware).
- ▶ Includes code for the LCD (not shown in the diagrams).

Controlling temperature using the fan

- ▶ The example feeds the heat assembly a constant (PWM) voltage.
- ▶ It then includes a PID controller with a fixed setpoint, trying to keep the temperature at a constant 45°C by sending a PWM signal to the fan.

Part III

OpenModelica Code Generator for Embedded Systems

Code Generator

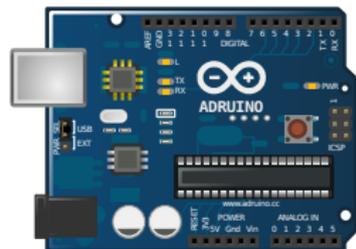

- ▶ Designed to support as many targets as possible.
- ▶ Supports few Modelica constructs.
- ▶ Focuses on generating good code with small footprint.
- ▶ Unsupported constructs such as linear systems are rejected.
- ▶ Reasonably predictable execution times.
- ▶ FMU-like interface (statically linked).

Code Generator Limitations

- ▶ No initialization.
- ▶ No strongly connected components.
- ▶ No events.
- ▶ No clocks.
- ▶ No functions (except some built-in and external C).

Target Agnostic

- ▶ No support for Atmel AVR or Arduino in the compiler.
- ▶ Compiler generates simple C code without use of OS or C library.
- ▶ Not a single malloc call, even during initialization.
- ▶ All hardware I/O and clocks is handled by the Modelica_DeviceDrivers library.

Using the Code Generator

Listing 1: Command sequence to use the code generator

```
# Generate a generic C-file
omc --preOptModules+=evaluateParameters --
    evaluateFinalParameters --evaluateProtectedParameters --
    replaceEvaluatedParameters -s --simCodeTarget=
    ExperimentalEmbeddedC M.mo
# Compile the C-code, targetting an ATmega328P clocked at @16
    MHz
avr-gcc -Os -std=c11 -ffunction-sections -fdata-sections -
    mmcu=atmega328p -DF_CPU=16000000UL -I ~/OpenModelica/
    build/include/omc/c -Wl,--gc-sections M_main.c -o M_avr -
    I ~/dev/Modelica_DeviceDrivers/Modelica_DeviceDrivers/
    Resources/Include /home/marsj/dev/SBHS/ModelicaLibs/
    libModelicaExternalC.a
# Create a hex-file used by avrdude
avr-objcopy -O ihex -R .eeprom M_avr M.hex
# Upload the hex-file corresponding to the controller using
    the Arduino USB protocol. Assume the processor is
    ATmega328P
avrdude -F -V -c arduino -p ATMEGA328P -P /dev/ttyACM0 -b
    115200 -U flash:w:M.hex
avr-size M_avr
```

Code Generator Comparison, Full vs Simple

	Old code generator: Full source-code FMU targeting 8-bit AVR	Simple code generator targeting 8-bit AVR
Hello World (0 equations)	43 kB flash memory 23 kB variables (RAM)	130 B flash memory 0 B variables (RAM)
SBHS Board (real-time PID, LCD, etc)	68 kB flash memory 25 kB variables (RAM)	4096 B flash memory 151 B variables (RAM)

Table: The full code generator has a high overhead due to large strings, etc. being embedded in the executable whereas the simple code generator only contains code that is necessary to simulate the model. It also consumes a lot more program memory when more equations are added to the system. The largest 8-bit AVR processor MCUs (Micro Controller Units) have 16 kB SRAM. The common ATmega328p (Arduino Uno) has 2 kB SRAM. The ATmega16 we target has 1 kB SRAM available (stack, heap, and global variables).

Part IV

Conclusion

SBHS controller using MDD and the new code generator

Future Work

- ▶ Initialization.
- ▶ Strongly connected components.
- ▶ Still no event support planned.
- ▶ Instead... clocks (synchronous Modelica), and rewriting MDD to use it.
- ▶ Function support.
- ▶ Most of this after we simplify the code generators in OpenModelica.
